

# The Temperley-Lieb Algebra (Planar Algebras, I)

Quantum Integers:

$$[n]_q := \frac{q^n - q^{-n}}{q - q^{-1}} = q^{n-1} + q^{n-3} + \dots + q^{-n+3} + q^{-n+1}$$

$$\Rightarrow [2]_q = q + q^{-1}$$

$$[3]_q = q^2 + 1 + q^{-2}$$

$$[4]_q = q^3 + q + q^{-1} + q^{-3}$$

$$[1]_q = ?$$

$$\text{When } q=1, [n]_q = n$$

Exercise:  $[2]_q [n]_q = [n-1]_q + [n+1]_q$

The Temperley-Lieb algebra:

$TL_n$  diagram: non-cross pairings on  $2n$  points

$TL_n$  is a  $\mathbb{C}$ -vector space w/ basis  $TL_n$  diagrams

$TL_n$  is an algebra:  $+$  is formal:

$$11 \cap + 1 \cap \cap + 4i 1 \cap \cap - \sqrt{2} 1 \cap \cap = 11 \cap + (1-\sqrt{2}) 1 \cap \cap + 4i 1 \cap \cap$$

• is by stacking:

$$1 \cap \cap + 1 \cap \cap = 1 \cap \cap = 1 \cap \cap$$

$$1 \cap \cap \cdot 1 \cap \cap = 1 \cap \cap = [2]_q 1 \cap \cap$$

(every closed circle  $\leadsto$  multiply by  $[2]_q$ )

$11 \dots 1$ , denoted  $1_n$ , is the multiplicative identity.

• it has a trace:  $\text{tr}(T) =$

We have inclusions  $TL_n \hookrightarrow TL_{n+1}$  (for fixed values of  $q$ )

So we tend to think of  $\{TL_n\}$  as a family of algebras

(2)

Recall: The Artin-Wedderburn thm says that (if hypotheses hold)

$$TL_n \cong \bigoplus_{i \in I} M_{n_i}(\mathbb{C}) \quad \exists n_i \in \mathbb{N}$$

$$TL_3 = \text{Span}_{\mathbb{C}} \{ |||, \overset{\vee}{\wedge} |, | \overset{\vee}{\wedge}, \overset{\vee}{\wedge} \overset{\vee}{\wedge}, \overset{\vee}{\wedge} \overset{\vee}{\wedge} \}$$

So ... as a matrix algebra,  $TL_3 = ?$

5 dim: so either  $\mathbb{C} \oplus \mathbb{C} \oplus \mathbb{C} \oplus \mathbb{C} \oplus \mathbb{C}$  or  $\mathbb{C} \oplus M_2 \mathbb{C}$

How do we tell?  $p \in A$  is a central projection if  $p^2 = p$  and  $\forall a \in A, pa = ap$ .

What is a minimal <sup>central</sup> projection?  $p$  s.t.  $\nexists$  central projections  $q$ ,  $q \neq 0$  or  $q \neq p$ .

Min. central projections of  $\mathbb{C}^{\oplus 5}$  are  $(1, 0, 0, 0, 0), (0, 1, 0, 0, 0) \dots$   
 Min. central projections of  $\mathbb{C} \oplus M_2 \mathbb{C}$  are  $(1, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}), (0, \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix})$

Q: What are the minimal central projections in  $TL_n$ ?

Q: Let's do it for  $TL_2$ :

Two projections:  $\frac{1}{\sqrt{2}} \overset{\vee}{\wedge}, || \cdot 1_2$   
 but!  $||$  is not minimal

$$|| \cdot \frac{1}{\sqrt{2}} \overset{\vee}{\wedge} = \frac{1}{\sqrt{2}} \overset{\vee}{\wedge}$$

so,  $|| - \frac{1}{\sqrt{2}} \overset{\vee}{\wedge}$  is the other minimal projection.

Exercise: What are min. central projections for  $TL_3$ ?

(3)

Def'n: The Jones-Wenzl projection is  $f^{(n)} \in TL(n)$  s.t.:

(0)  $f^{(n)} \neq 0$

(1)  $f^{(n)} f^{(n)} = f^{(n)}$

(2)  $f^{(n)}$  is uncappable:  $\boxed{f^{(n)}} = 0, \boxed{f^{(n)}} = 0$

positions of cap.

(N.B.: this says something about an element of  $TL_{n \rightarrow (n-2)}$  or  $TL_{(n-2) \rightarrow n}$ )

Thm:  $f^{(n)}$  exists, is unique.

Lemma 1:  $D_1, D_2$  are diagrams in  $TL_n$ .  $D_1 D_2 = \#_n \Rightarrow D_1 = D_2 = \mathbb{I}_n$

pf: # through strands of  $D_1 D_2 \leq$

$\min(\# \text{ through strands of } D_i)$

and  $\mathbb{I}_n$  is only diagram w/  $n$  through strands.

Lemma 2: If  $P$  is a projection, coeff. of  $\mathbb{I}_n$  in  $P$  is 0 or 1.

proof:

$$P = k \cdot \mathbb{I}_n + \underbrace{(P - k \cdot \mathbb{I}_n)}_{\text{lin combo of diagrams w/ < n thru strands}}$$

$$P = P^2 = k^2 \mathbb{I}_n + \underbrace{2k(P - k \cdot \mathbb{I}_n)}_{\substack{\text{coeff of } \mathbb{I}_n \text{ here} \\ = 0}} + \underbrace{(P - k \cdot \mathbb{I}_n)^2}_{\substack{\text{coeff of } \mathbb{I}_n \text{ here} \\ = 0}}$$

so,  $k^2 = k \Rightarrow k = 0$  or  $1$ .

□

Note:  $f$  uncappable,  $D_k$  is non- $\mathbb{1}_n$   $\Rightarrow$  diagram:  $f \cdot D_k = D_k \cdot f = 0$

Ex: Coeff of  $\mathbb{1}_n$  in an uncappable projection is 1.

Exercise:  $f^{(n)} \cdot f^{(m)} = f^{(\max\{n,m\})}$

Lemma 3: If  $P, Q$  are both uncappable, coeff of  $\mathbb{1}_n$  in  $P$  is 1, then  $Q$  is some multiple of  $P$ .

proof:  $P = \mathbb{1}_n + (P - \mathbb{1}_n)$   
 $Q = c \cdot \mathbb{1}_n + (Q - \mathbb{1}_n)$

$$PQ = \mathbb{1}_n \cdot Q + (P - \mathbb{1}_n) \cdot Q = Q + 0 = Q$$

and

$$PQ = c \cdot P \cdot \mathbb{1}_n + P \cdot (Q - \mathbb{1}_n) = c \cdot P + 0 = cP$$

$$\text{Hence } cP = Q.$$

Cor: If  $f^{(n)}$  exists, it is unique.

(5)

Lemma 4:

$$(a_n) \text{ of } f^{(n-1)} \text{ exists, } \boxed{f^{(n-1)}} = \frac{[n]_q}{[n-1]_q} \boxed{f^{(n-2)}}$$

(b\_n) If  $[n]_q \neq 0$  <sup>and  $f^{(n-1)}$  exists</sup>, then  $f^{(n)}$  exists + satisfies Wenzl's relation:

$$\boxed{f^{(n)}} = \boxed{f^{(n-1)}} - \frac{[n-1]_q}{[n]_q} \boxed{f^{(n-1)} \circ f^{(n-1)}}$$

Exercise: Generate  $f^{(3)}$ , compare it to the min. central projections of  $TL_3$ .

proof: by induction:

$$\begin{aligned} \text{base case: } n=0: f^{(0)} &= \emptyset \\ n=1: f^{(1)} &= | \\ n=2: f^{(2)} &= || - \frac{1}{[2]_q} \cup \end{aligned}$$

$$(a_2) \boxed{f^{(1)}} = 0 = [2]_q = \frac{[2]_q}{[1]_q} \emptyset \quad \checkmark$$

$$(b_2) f^{(2)} = \boxed{f^{(1)}} - \frac{1}{[2]_q} \boxed{\begin{array}{c} \boxed{f^{(1)}} \\ \boxed{f^{(1)}} \end{array}} \quad \checkmark$$

ind. step:  $(a_{n-1}), (b_{n-1}) \Rightarrow (a_n) \Rightarrow (b_n)$

$$\text{Given } (b_{n-1}): f^{(n-1)} = \boxed{f^{(n-2)}} - \frac{[n-2]_q}{[n-1]_q} \boxed{\begin{array}{c} \boxed{f^{(n-2)}} \\ \boxed{f^{(n-2)}} \end{array}} :$$

(a)

$$\begin{aligned}
 \boxed{f(n-1)} &= \boxed{\phantom{f(n-1)}} - \frac{[n-2]}{[n-1]} \boxed{f(n-1)} \\
 &= \left( [2] - \frac{[n-2]}{[n-1]} \right) \boxed{\phantom{f(n-1)}} = \frac{[n]}{[n-1]} \boxed{\phantom{f(n-1)}}
 \end{aligned}$$

(b)

$$\text{RHS} = \boxed{f(n-1)} - \frac{[n-1]}{[n]} \boxed{f(n-1)}$$

use JW properties:

$$\bullet \boxed{\text{RHS}} = \dots = \frac{[n+1]}{[n]} \cdot f^{(n-1)} \neq 0$$

• projection:

$$\begin{aligned}
 & \boxed{\phantom{f(n-1)}} - \frac{[n-1]}{[n]} \boxed{f(n-1)} - \frac{[n-1]}{[n]} \boxed{f(n-1)} + \frac{[n-1]^2}{[n]^2} \boxed{f(n-1)} \\
 &= \boxed{\phantom{f(n-1)}} - 2 \frac{[n-1]}{[n]} \boxed{f(n-1)} + \frac{[n-1]^2}{[n]^2} \cdot \frac{[n]}{[n-1]} \boxed{f(n-1)} \\
 &= \boxed{\phantom{f(n-1)}} - \frac{[n-1]}{[n]} \boxed{f(n-1)}
 \end{aligned}$$

• Exercise: Show that RHS is uncappable.
